Photo Guide to Installing Decals

STEP 1

Place the decal on a flat hard surface, and use a credit card to squeegee the top mask (the translucent paper) hard onto the decal below.

STEP 2

Position your decal where you want it and create a hinge using masking tape by taping across only the top edge of the decal.

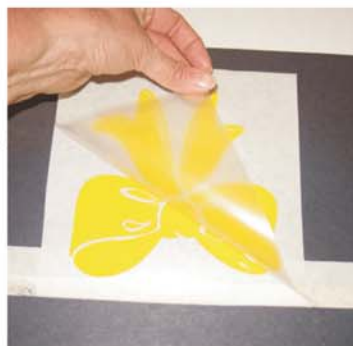

STEP 3

Flip up the decal so that you are looking at the bottom side (where the KartattooZ label is)

STEP 4

Slowly and at a diagonal starting from the edge nearest the mask tape, peel back the backing. If the decal starts to lift, use the credit card to squeegee it against the front mask tape again.

STEP 5

Finish peeling off the backing and toss it aside

NOTE: For solid decals, or large decals, you may want to use the wet method - spray bottle with 1 qt water + 1 drop dishwashing liquid - spray the surface where the decal will be placed.

Grab the bottom 2 corners of the decal and make sure it is very flat as you position the decal against the surface. Squeegee forcefully from the center out. Repeat several times, in all directions, pushing out any trapped air. Squeegee for several minutes, especially if you have used the wet method.

STEP 6

STEP 7

When done with that start to lift the mask at a diagonal, away from the decal. The decal adhesive is stronger than the mask adhesive, so the decal remains behind. If it starts to lift, simply lower the mask and squeegee some more.

STEP 8

Toss the mask, and you are done. The decal might have a few small air bubbles (look like little zits) but those will dissipate by themselves after a week or so. If there are larger bubbles, (M&M size) then use a pin to let the air out.
